

# ELF for the ARM® 64-bit Architecture (AArch64)

Document number: ARM IHI 0056B, current through AArch64 ABI release 1.0

Date of Issue: 22<sup>nd</sup> May 2013

## **Abstract**

This document describes the use of the ELF binary file format in the Application Binary Interface (ABI) for the ARM 64-bit architecture.

# **Keywords**

ELF, AArch64 ELF, ...

# How to find the latest release of this specification or report a defect in it

Please check the *ARM Information Center* (<a href="http://infocenter.arm.com/">http://infocenter.arm.com/</a>) for a later release if your copy is more than 3 months old (navigate to the *Software Development Tools* section, *Application Binary Interface for the ARM Architecture* subsection). Please report defects in this specification to *arm* dot *eabi* at *arm* dot *com*.

#### Licence

THE TERMS OF YOUR ROYALTY FREE LIMITED LICENCE TO USE THIS ABI SPECIFICATION ARE GIVEN IN SECTION **1.4, Your licence to use this specification** (ARM contract reference **LEC-ELA-00081 V2.0**). PLEASE READ THEM CAREFULLY.

BY DOWNLOADING OR OTHERWISE USING THIS SPECIFICATION, YOU AGREE TO BE BOUND BY ALL OF ITS TERMS. IF YOU DO NOT AGREE TO THIS, DO NOT DOWNLOAD OR USE THIS SPECIFICATION.

THIS ABI SPECIFICATION IS PROVIDED "AS IS" WITH NO WARRANTIES (SEE SECTION 1.4 FOR DETAILS).

## 1.3 Terms and abbreviations

The ABI for the ARM 64-bit Architecture uses the following terms and abbreviations.

Term	Meaning
A32	The instruction set named <i>ARM</i> in the ARMv7 architecture; A32 uses 32-bit fixed-length instructions.
A64	The instruction set available when in AArch64 state.
AAPCS64	Procedure Call Standard for the ARM 64-bit Architecture (AArch64)
AArch32	The 32-bit general-purpose register width state of the ARMv8 architecture, broadly compatible with the ARMv7-A architecture.
AArch64	The 64-bit general-purpose register width state of the ARMv8 architecture.
ABI	Application Binary Interface:
	1. The specifications to which an executable must conform in order to execute in a specific execution environment. For example, the <i>Linux ABI for the ARM Architecture</i> .
	<ol> <li>A particular aspect of the specifications to which independently produced relocatable files must conform in order to be statically linkable and executable. For example, the C++ ABI for the ARM Architecture, ELF for the ARM Architecture,</li> </ol>
ARM-based	based on the ARM architecture
Floating point	Depending on context <i>floating point</i> means or qualifies: (a) floating-point arithmetic conforming to IEEE 754 2008; (b) the ARMv8 floating point instruction set; (c) the register set shared by (b) and the ARMv8 SIMD instruction set.
Q-o-l	Quality of Implementation – a quality, behavior, functionality, or mechanism not required by this standard, but which might be provided by systems conforming to it. Q-o-I is often used to describe the tool-chain-specific means by which a standard requirement is met.
SIMD	Single Instruction Multiple Data – A term denoting or qualifying: (a) processing several data items in parallel under the control of one instruction; (b) the ARM v8 SIMD instruction set: (c) the register set shared by (b) and the ARMv8 floating point instruction set.
SIMD and floating point	The ARM architecture's SIMD and Floating Point architecture comprising the floating point instruction set, the SIMD instruction set and the register set shared by them.
T32	The instruction set named <i>Thumb</i> in the ARMv7 architecture; T32 uses 16-bit and 32-bit instructions.

Other terms may be defined when first used.

# 1.4 Your licence to use this specification

**IMPORTANT**: THIS IS A LEGAL AGREEMENT ("LICENCE") BETWEEN YOU (AN INDIVIDUAL OR SINGLE ENTITY WHO IS RECEIVING THIS DOCUMENT DIRECTLY FROM ARM LIMITED) ("LICENSEE") AND ARM LIMITED ("ARM") FOR THE SPECIFICATION DEFINED IMMEDITATELY BELOW. BY DOWNLOADING OR OTHERWISE USING IT, YOU AGREE TO BE BOUND BY ALL OF THE TERMS OF THIS LICENCE. IF YOU DO NOT AGREE TO THIS, DO NOT DOWNLOAD OR USE THIS SPECIFICATION.

"Specification" means, and is limited to, the version of the specification for the Applications Binary Interface for the ARM Architecture comprised in this document. Notwithstanding the foregoing, "Specification" shall not include (i) the implementation of other published specifications referenced in this Specification; (ii) any enabling technologies

that may be necessary to make or use any product or portion thereof that complies with this Specification, but are not themselves expressly set forth in this Specification (e.g. compiler front ends, code generators, back ends, libraries or other compiler, assembler or linker technologies; validation or debug software or hardware; applications, operating system or driver software; RISC architecture; processor microarchitecture); (iii) maskworks and physical layouts of integrated circuit designs; or (iv) RTL or other high level representations of integrated circuit designs.

Use, copying or disclosure by the US Government is subject to the restrictions set out in subparagraph (c)(1)(ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 or subparagraphs (c)(1) and (2) of the Commercial Computer Software – Restricted Rights at 48 C.F.R. 52.227-19, as applicable.

This Specification is owned by ARM or its licensors and is protected by copyright laws and international copyright treaties as well as other intellectual property laws and treaties. The Specification is licensed not sold.

- 1. Subject to the provisions of Clauses 2 and 3, ARM hereby grants to LICENSEE, under any intellectual property that is (i) owned or freely licensable by ARM without payment to unaffiliated third parties and (ii) either embodied in the Specification or Necessary to copy or implement an applications binary interface compliant with this Specification, a perpetual, non-exclusive, non-transferable, fully paid, worldwide limited licence (without the right to sublicense) to use and copy this Specification solely for the purpose of developing, having developed, manufacturing, having manufactured, offering to sell, selling, supplying or otherwise distributing products which comply with the Specification.
- 2. THIS SPECIFICATION IS PROVIDED "AS IS" WITH NO WARRANTIES EXPRESS, IMPLIED OR STATUTORY, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF SATISFACTORY QUALITY, MERCHANTABILITY, NONINFRINGEMENT OR FITNESS FOR A PARTICULAR PURPOSE. THE SPECIFICATION MAY INCLUDE ERRORS. ARM RESERVES THE RIGHT TO INCORPORATE MODIFICATIONS TO THE SPECIFICATION IN LATER REVISIONS OF IT, AND TO MAKE IMPROVEMENTS OR CHANGES IN THE SPECIFICATION OR THE PRODUCTS OR TECHNOLOGIES DESCRIBED THEREIN AT ANY TIME.
- 3. This Licence shall immediately terminate and shall be unavailable to LICENSEE if LICENSEE or any party affiliated to LICENSEE asserts any patents against ARM, ARM affiliates, third parties who have a valid licence from ARM for the Specification, or any customers or distributors of any of them based upon a claim that a LICENSEE (or LICENSEE affiliate) patent is Necessary to implement the Specification. In this Licence; (i) "affiliate" means any entity controlling, controlled by or under common control with a party (in fact or in law, via voting securities, management control or otherwise) and "affiliated" shall be construed accordingly; (ii) "assert" means to allege infringement in legal or administrative proceedings, or proceedings before any other competent trade, arbitral or international authority; (iii) "Necessary" means with respect to any claims of any patent, those claims which, without the appropriate permission of the patent owner, will be infringed when implementing the Specification because no alternative, commercially reasonable, non-infringing way of implementing the Specification is known; and (iv) English law and the jurisdiction of the English courts shall apply to all aspects of this Licence, its interpretation and enforcement. The total liability of ARM and any of its suppliers and licensors under or in relation to this Licence shall be limited to the greater of the amount actually paid by LICENSEE for the Specification or US\$10.00. The limitations, exclusions and disclaimers in this Licence shall apply to the maximum extent allowed by applicable law.

# 2 ABOUT THIS SPECIFICATION

This specification provides the processor-specific definitions required by ELF [SCO-ELF] for AArch64-based systems.

The ELF specification is part of the larger Unix System V (SysV) ABI specification where it forms chapters 4 and 5. However, the ELF specification can be used in isolation as a generic object and executable format.

Section 3 of this document covers ELF related matters that are platform specific.

Sections 4 and 5 of this document are structured to correspond to chapters 4 and 5 of the ELF specification. Specifically:

- □ Section 4 covers object files and relocations
- □ Section 5 covers program loading and dynamic linking.

# 3 PLATFORM STANDARDS (EXAMPLE ONLY)

We expect that each operating system that adopts components of this ABI specification will specify additional requirements and constraints that must be met by application code in binary form and the code-generation tools that generate such code.

As an example of the kind of issue that must be addressed §3.1, below, lists some of the issues addressed by the *Linux Standard Base* [LSB] specifications.

## 3.1 Linux Platform ABI (example only)

## 3.1.1 Symbol Versioning

The Linux ABI uses the GNU-extended Solaris symbol versioning mechanism [SYM-VER].

Concrete data structure descriptions can be found in /usr/include/sys/link.h (Solaris), /usr/include/elf.h (Linux), in the *Linux Standard Base specifications* [LSB], and in Drepper's paper [SYM-VER].

A binary file intended to be specific to Linux shall set the EI\_OSABI field to the value required by Linux [LSB].

## 3.1.2 Program Linkage Table (PLT) Sequences and Usage Models

#### 3.1.2.1 Symbols for which a PLT entry must be generated

A PLT entry implements a long-branch to a destination outside of this executable file. In general, the static linker knows only the name of the destination. It does not know its address. Such a location is called an *imported* location or *imported* symbol.

SysV-based *Dynamic Shared Objects* (DSOs) (e.g. for Linux) also require functions *exported* from an executable file to have PLT entries. In effect, exported functions are treated as if they were imported, so that their definitions can be overridden (pre-empted) at dynamic link time.

A linker must generate a PLT entry for each *candidate* symbol cited by a relocation directive that relocates an AArch64 B/BL-class instruction (§4.6.7). For a Linux/SysV DSO, each STB\_GLOBAL symbol with STV\_DEFAULT visibility is a candidate.

#### 3.1.2.2 Overview of PLT entry code generation

A PLT entry must be able to branch any distance. This is typically achieved by loading the destination address from the corresponding *Global Object Table* (GOT) entry.

On-demand dynamic linking constrains the code sequences that can be generated for a PLT entry. Specifically, there is a requirement from the dynamic linker for certain registers to contain certain values. Typically these are:

_	The eddson	برملم من سمم	af 4la a a	4	ا المادة ما المالية	
ᆸ	The address	s or maex	or the o	i not-ve	it-iinkea PL i	enuv.

☐ The return address of the call to the PLT entry.

The register interface to the dynamic linker is specified by the host operating system.

# **4 OBJECT FILES**

## 4.1 Introduction

## 4.1.1 Registered Vendor Names

Various symbols and names may require a vendor-specific name to avoid the potential for name-space conflicts. The list of currently registered vendors and their preferred short-hand name is given in *Table 4-1, Registered Vendors*. Tools developers not listed are requested to co-ordinate with ARM to avoid the potential for conflicts.

Table 4-1, Registered Vendors

Name	Vendor		
aeabi	Reserved to the ABI for the ARM Architecture (EABI pseudo-vendor)		
AnonXyz anonXyz	Reserved to private experiments by the <i>Xyz</i> vendor. Guaranteed not to clash with any registered vendor name.		
ARM	ARM Ltd (Note: the company, not the processor).		
cxa	C++ ABI pseudo-vendor		
FSL	Freescale Semiconductor Inc.		
GHS	Green Hills Systems		
gnu	GNU compilers and tools (Free Software Foundation)		
iar	IAR Systems		
intel	Intel Corporation		
ixs	Intel Xscale		
llvm	The LLVM/Clang projects		
PSI	PalmSource Inc.		
RAL	Rowley Associates Ltd		
somn	SOMNIUM Technologies Limited.		
TASKING	Altium Ltd.		
TI	TI Inc.		
tls	Reserved for use in thread-local storage routines.		
WRS	Wind River Systems.		

To register a vendor prefix with ARM, please E-mail your request to  ${\tt arm.eabi}$  at  ${\tt arm.com}$ .

## 4.2 ELF Header

The ELF header provides a number of fields that assist in interpretation of the file. Most of these are specified in the base standard. The following fields have ARM-specific meanings.

#### e machine

An object file conforming to this specification must have the value EM AARCH64 (183, 0xB7).

#### e\_entry

The base ELF specification requires this field to be zero if an application does not have an entry point. Nonetheless, some applications may require an entry point of zero (for example, via a reset vector).

A platform standard may specify that an executable file always has an entry point, in which case e\_entry specifies that entry point, even if zero.

#### e flags

There are no processor-specific flags so this field shall contain zero.

#### 4.2.1 ELF Identification

The 16-byte ELF identification (e\_ident) provides information on how to interpret the file itself. The following values shall be used on ARM systems

#### EI CLASS

An AArch64 ELF file shall contain ELFCLASS64 objects.

#### EI DATA

This field may be either ELFDATA2LSB or ELFDATA2MSB. The choice will be governed by the default data order in the execution environment.

#### EI OSABI

This field shall be zero unless the file uses objects that have flags which have OS-specific meanings (for example, it makes use of a section index in the range SHN LOOS through SHN HIOS).

## 4.3 Sections

## 4.3.1 Special Section Indexes

No processor-specific special section indexes are defined. All processor-specific values are reserved to future revisions of this specification.

## 4.3.2 Section Types

The defined processor-specific section types are listed in *Table 4-2, Processor specific section types*. All other processor-specific values are reserved to future revisions of this specification.

Table 4-2, Processor specific section types

Name	Value	Comment
SHT_AARCH64_ATTRIBUTES	0x70000003	Reserved for Object file compatibility attributes

#### 4.3.3 Section Attribute Flags

There are no processor-specific section attribute flags defined. All processor-specific values are reserved to future revisions of this specification.

#### 4.3.3.1 Merging of objects in sections with SHF\_MERGE

In a section with the SHF\_MERGE flag set, duplicate used objects may be merged and unused objects may be removed. An object is *used* if:

- □ A relocation directive addresses the object via the section symbol with a suitable addend to point to the object.
- □ A relocation directive addresses a symbol within the section. The used object is the one addressed by the symbol irrespective of the addend used.

## 4.3.4 Special Sections

Table 4-3, AArch64 special sections lists the special sections defined by this ABI.

#### Table 4-3, AArch64 special sections

Name	Туре	Attributes	
.ARM.attributes	SHT_AARCH64_ATTRIBUTES	none	

<sup>.</sup>ARM.attributes names a section that contains build attributes. See §4.3.6 Build Attributes.

Additional special sections may be required by some platforms standards.

## 4.3.5 Section Alignment

There is no minimum alignment required for a section. Sections containing code must be at least 4-byte aligned. Platform standards may set a limit on the maximum alignment that they can guarantee (normally the minimum page size supported by the platform).

#### 4.3.6 Build Attributes

Build attributes are encoded in a section of type SHT\_AARCH64\_ATTRIBUTES, and name .ARM.attributes.

Build attributes are unnecessary when a platform ABI operating system is fully specified. At this time no public build attributes have been defined for AArch64, however, software development tools are free to use attributes privately. For an introduction to AArch32 build attributes see [Addenda32].

## 4.4 String Table

There are no processor-specific extensions to the string table.

# 4.5 Symbol Table

There are no processor-specific symbol types or symbol bindings. All processor-specific values are reserved to future revisions of this specification.

## 4.5.1 Weak Symbols

There are two forms of weak symbol:

- □ A weak reference This is denoted by st\_shndx=SHN\_UNDEF, ELF64\_ST\_BIND()=STB\_WEAK.
- □ A weak definition This is denoted by st shndx!=SHN UNDEF, ELF64 ST BIND()=STB WEAK.

#### 4.5.1.1 Weak References

Libraries are not searched to resolve weak references. It is not an error for a weak reference to remain unsatisfied.

During linking, the symbol value of an undefined weak reference is:

- □ Zero if the relocation type is absolute
- ☐ The address of the place if the relocation type is pc-relative.

See §4.6 Relocation for further details.

#### 4.5.1.2 Weak Definitions

A weak definition does not change the rules by which object files are selected from libraries. However, if a link set contains both a weak definition and a non-weak definition, the non-weak definition will always be used.

## 4.5.2 Symbol Types

All code symbols exported from an object file (symbols with binding STB\_GLOBAL) shall have type STT\_FUNC.

All extern data objects shall have type STT\_OBJECT. No STB\_GLOBAL data symbol shall have type STT\_FUNC.

The type of an undefined symbol shall be STT\_NOTYPE or the type of its expected definition.

The type of any other symbol defined in an executable section can be STT\_NOTYPE. A linker is only required to provide long-branch and PLT support for symbols of type STT\_FUNC.

## 4.5.3 Symbol names

A symbol that names a C or assembly language entity should have the name of that entity. For example, a C function called calculate generates a symbol called calculate (not \_calculate).

Symbol names are case sensitive and are matched exactly by linkers.

Any symbol with binding STB\_LOCAL may be removed from an object and replaced with an offset from another symbol in the same section under the following conditions:

- ☐ The original symbol and replacement symbol are not of type STT\_FUNC, or both symbols are of type STT\_FUNC.
- All relocations referring to the symbol can accommodate the adjustment in the addend field (it is permitted to convert a REL type relocation to a RELA type relocation).
- ☐ The symbol is not described by the debug information.
- ☐ The symbol is not a mapping symbol (§4.5.4).
- ☐ The resulting object, or image, is not required to preserve accurate symbol information to permit decompilation or other post-linking optimization techniques.
- □ If the symbol labels an object in a section with the SHF\_MERGE flag set, the relocation using symbol may be changed to use the section symbol only if the initial addend of the relocation is zero.

No tool is required to perform the above transformations; an object consumer must be prepared to do this itself if it might find the additional symbols confusing.

**Note** Multiple conventions exist for the names of compiler temporary symbols (for example, ARMCC uses Lxxx.yyy, while GNU tools use .Lxxx).

#### 4.5.3.1 Reserved symbol names

The following symbols are reserved to this and future revisions of this specification:

- Local symbols (STB\_LOCAL) beginning with '\$'
- □ Symbols matching the pattern *non-empty-prefix*\$\$*non-empty-suffix*.
- Global symbols (STB GLOBAL, STB WEAK) beginning with 'aeabi' (double 'at start).

Note that global symbols beginning with '\_\_vendor\_' (double '\_' at start), where *vendor* is listed in §4.1.1, *Registered Vendor Names*, are reserved to the named vendor for the purpose of providing vendor-specific toolchain support functions.

## 4.5.4 Mapping symbols

A section of an ELF file can contain a mixture of A64 code and data. There are inline transitions between code and data at literal pool boundaries.

Linkers, file decoders and other tools need to map binaries correctly. To support this, a number of symbols, termed *mapping symbols* appear in the symbol table to label the start of each sequence of bytes of the appropriate class. All mapping symbols have type STT\_NOTYPE and binding STB\_LOCAL. The st\_size field is unused and must be zero.

The mapping symbols are defined in *Table 4-4, Mapping symbols*. It is an error for a relocation to reference a mapping symbol. Two forms of mapping symbol are supported:

- A short form that uses a dollar character and a single letter denoting the class. This form can be used when an object producer creates mapping symbols automatically. Its use minimizes string table size.
- □ A longer form in which the short form is extended with a period and then any sequence of characters that are legal for a symbol. This form can be used when assembler files have to be annotated manually and the assembler does not support multiple definitions of symbols.

Mapping symbols defined in a section (relocatable view) or segment (executable view) define a sequence of halfopen intervals that cover the address range of the section or segment. Each interval starts at the address defined by the mapping symbol, and continues up to, but not including, the address defined by the next (in address order) mapping symbol or the end of the section or segment. A section that contains instructions must have a mapping symbol defined at the beginning of the section. If a section contains only data no mapping symbol is required. A platform ABI should specify whether or not mapping symbols are present in the executable view; they will never be present in a *stripped* executable file.

Table 4-4, Mapping symbols

Name	Meaning
\$x \$x. <any></any>	Start of a sequence of A64 instructions
\$d \$d.< <i>any&gt;</i>	Start of a sequence of data items (for example, a literal pool)

## 4.6 Relocation

Relocation information is used by linkers to bind symbols to addresses that could not be determined when the binary file was generated. Relocations are classified as *Static* or *Dynamic*.

- ☐ A static relocation relocates a place in an ELF relocatable file (e\_type = ET\_REL); a static linker processes it.
- □ A *dynamic relocation* is designed to relocate a place in an ELF executable file or dynamic shared object (e\_type = ET\_EXEC, ET\_DYN) and to be handled by a dynamic linker, program loader, or other post-linking tool (*dynamic linker* henceforth).
- □ A dynamic linker need only process dynamic relocations; a static linker must handle any defined relocation.
- □ Dynamic relocations are designed to be processed quickly.
  - There are a small number of dynamic relocations whose codes are contiguous from 1024.
  - Dynamic relocations relocate simple places and do not need complex field extraction or insertion.
- □ A static linker either:
  - Fully resolves a relocation directive.
  - Or, generates a dynamic relocation from it for processing by a dynamic linker.
- □ A well-formed executable file or dynamic shared object has no static relocations after static linking.

#### 4.6.1 Relocation codes

The relocation codes for AArch64 are divided into four categories:

- ☐ Mandatory relocations that must be supported by all static linkers.
- □ Platform-specific relocations required by specific platform ABIs.
- □ Private relocations that are guaranteed never to be allocated in future revisions of this specification, but which must never be used in portable object files.
- □ Unallocated relocations that are reserved for use in future revisions of this specification.

#### 4.6.2 Addends and PC-bias

A binary file may use REL or RELA relocations or a mixture of the two (but multiple relocations of the same place must use only one type).

The initial addend for a REL-type relocation is formed according to the following rules.

- ☐ If the relocation relocates data (§4.6.5) the initial value in the place is sign-extended to 64 bits.
- ☐ If the relocation relocates an instruction the immediate field of the instruction is extracted, scaled as required by the instruction field encoding, and sign-extended to 64 bits.

A RELA format relocation must be used if the initial addend cannot be encoded in the place.

There is no PC bias to accommodate in the relocation of a place containing an instruction that formulates a PC-relative address. The program counter reflects the address of the currently executing instruction.

#### 4.6.3 Relocation types

Tables in the following sections list the relocation codes for AArch64 and record the following.

- ☐ The relocation code which is stored in the ELF64\_R\_TYPE component of the r\_info field.
- ☐ The preferred mnemonic *name* for the relocation. This has no significance in a binary file.
- □ The *relocation operation* required. This field describes how a symbol and addend are processed by a linker. It does not describe how an initial addend value is extracted from a place (§4.6.2) or how the resulting relocated value is inserted or encoded into a place.
- □ A *comment* describing the kind of place that can be relocated, the part of the result value inserted into the place, and whether or not field overflow should be checked.

Static relocation codes begin at 257; dynamic relocation codes at 1024. Both 0 and 256 should be accepted as values of R\_AARCH64\_NONE, the null relocation. All unallocated type codes are reserved for future allocation.

The following nomenclature is used in the descriptions of relocation operations:

- ☐ S (when used on its own) is the address of the symbol.
- $\square$  A is the addend for the relocation.
- $\square$  P is the address of the *place* being relocated (derived from r offset).
- □ x is the result of a relocation operation, before any masking or bit-selection operation is applied
- $\square$  Page (expr) is the page address of the expression expr, defined as (expr & ~0xFFF). (This applies even if the machine page size supported by the platform has a different value.)
- ☐ GOT is the address of the Global Offset Table, the table of code and data addresses to be resolved at dynamic link time. The GOT and each entry in it must be 64-bit aligned.
- ☐ GDAT(S+A) represents a 64-bit entry in the GOT for address S+A. The entry will be relocated at run time with relocation R\_AARCH64\_GLOB\_DAT(S+A).
- $\Box$  G(expr) is the address of the GOT entry for the expression *expr*.
- $\square$  Delta(S) if S is a normal symbol, resolves to the difference between the static link address of S and the execution address of S. If S is the null symbol (ELF symbol index 0), resolves to the difference between the static link address of P and the execution address of P.
- □ Indirect(expr) represents the result of calling expr as a function. The result is the return value from the function that is returned in r0. The arguments passed to the function are defined by the platform ABI.
- □ [msb:lsb] is a bit-mask operation representing the selection of bits in a value. The bits selected range from lsb up to msb inclusive. For example, 'bits [3:0]' represents the bits under the mask 0x0000000F. When range checking is applied to a value, it is applied before the masking operation is performed.

The value written into a target field is always reduced to fit the field. It is Q-o-I whether a linker generates a diagnostic when a relocated value overflows its target field.

Relocation types whose names end with "\_NC" are *non-checking* relocation types. These *must not* generate diagnostics in case of field overflow. Usually, a non-checking type relocates an instruction that computes one of the less significant parts of a single value computed by a group of instructions (§4.6.8). Only the instruction computing the most significant part of the value can be checked for field overflow because, in general, a relocated value *will* overflow the fields of instructions computing the less significant parts. Some non-checking relocations may, however, be expected to check for correct alignment of the result; the notes explain when this is permitted.

#### 4.6.4 Static miscellaneous relocations

R\_AARCH64\_NONE (null relocation code) records that the section containing the place to be relocated depends on the section defining the symbol mentioned in the relocation directive in a way otherwise invisible to a static linker. The effect is to prevent removal of sections that might otherwise appear to be unused.

Table 4-5, Null relocation codes

Code	Name	Operation	Comment
0	R_AARCH64_NONE	None	
256	withdrawn	None	Treat as R_AARCH64_NONE.

#### 4.6.5 Static Data relocations

See also Table 4-13, GOT-relative data relocations.

Table 4-6, Data relocations

Code	Name	Operation	Overflow check
257	R_AARCH64_ABS64	S + A	None
258	R_AARCH64_ABS32	S + A	$-2^{31} \le X < 2^{32}$
259	R_AARCH64_ABS16	S + A	$-2^{15} \le X < 2^{16}$
260	R_AARCH64_PREL64	S + A - P	None
261	R_AARCH64_PREL32	S + A - P	$-2^{31} \le X < 2^{32}$
262	R_AARCH64_PREL16	S + A - P	$-2^{15} \le X < 2^{16}$

These overflow ranges permit either signed or unsigned narrow values to be created from the intermediate result viewed as a 64-bit signed integer. If the place is intended to hold a narrow signed value and  $INTn\_MAX < X \le UINTn\_MAX$ , no overflow will be detected but the positive result will be interpreted as a negative value.

### 4.6.6 Static AArch64 relocations

The following tables record single instruction relocations and relocations that allow a group or sequence of instructions to compute a single relocated value.

Table 4-7, Group relocations to create a 16-, 32-, 48-, or 64-bit unsigned data value or address inline

**Note** Non-checking (\_NC) forms relocate MOVK; checking forms relocate MOVZ except R\_AARCH64\_MOVW\_UABS\_G3, which can relocate either.

Code	Name	Operation	Comment
263	R_AARCH64_MOVW_UABS_G0	S + A	Set a MOVZ immediate field to bits [15:0] of X; check that $0 \le X < 2^{16}$
264	R_AARCH64_MOVW_UABS_G0_NC	S + A	Set a MOVK immediate field to bits [15:0] of X. No overflow check
265	R_AARCH64_MOVW_UABS_G1	S + A	Set a MOVZ immediate field to bits [31:16] of X; check that $0 \le X < 2^{32}$
266	R_AARCH64_MOVW_UABS_G1_NC	S + A	Set a MOVK immediate field to bits [31:16] of X. No overflow check
267	R_AARCH64_MOVW_UABS_G2	S + A	Set a MOVZ immediate field to bits [47:32] of X; check that $0 \le X < 2^{48}$

Code	Name	Operation	Comment
268	R_AARCH64_MOVW_UABS_G2_NC	S + A	Set a MOVK immediate field to bits [47:32] of X. No overflow check
269	R_AARCH64_MOVW_UABS_G3	S + A	Set a MOV[KZ] immediate field to bits [63:48] of X (no overflow check needed)

## Table 4-8, Group relocations to create a 16, 32, 48, or 64 bit signed data or offset value inline

Note These checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
270	R_AARCH64_MOVW_SABS_G0	S + A	Set a MOV[NZ] immediate field using bits [15:0] of X (see notes below); check $-2^{16} \le X < 2^{16}$
271	R_AARCH64_MOVW_SABS_G1	S + A	Set a MOV[NZ] immediate field using bits [31:16] of X (see notes below); check $-2^{32} \le X < 2^{32}$
272	R_AARCH64_MOVW_SABS_G2	S + A	Set a MOV[NZ] immediate field using bits [47:32] of X (see notes below); check $-2^{48} \le X < 2^{48}$

**Note**  $X \ge 0$ : Set the instruction to MOVZ and its immediate field to the selected bits of X.

**Note** X < 0: Set the instruction to MOVN and its immediate field to NOT (selected bits of X).

Table 4-9, Relocations to generate 19, 21 and 33 bit PC-relative addresses

Code	Name	Operation	Comment
273	R_AARCH64_ LD_PREL_LO19	S + A - P	Set a load-literal immediate value to bits [20:2] of X; check that $-2^{20} \le X < 2^{20}$
274	R_AARCH64_ ADR_PREL_LO21	S + A - P	Set an ADR immediate value to bits [20:0] of X; check that - $2^{20} \le X < 2^{20}$
275	R_AARCH64_ ADR_PREL_PG_HI21	Page(S+A) -Page(P)	Set an ADRP immediate value to bits [32:12] of the X; check that $-2^{32} \le X < 2^{32}$
276	R_AARCH64_ ADR_PREL_PG_HI21_NC	Page(S+A) -Page(P)	Set an ADRP immediate value to bits [32:12] of the X. No overflow check
277	R_AARCH64_ ADD_ABS_LO12_NC	S + A	Set an ADD immediate value to bits [11:0] of X. No overflow check. Used with relocations ADR_PREL_PG_HI21 and ADR_PREL_PG_HI21_NC
278	R_AARCH64_ LDST8_ABS_LO12_NC	S + A	Set an LD/ST immediate value to bits [11:0] of X. No overflow check. Used with relocations ADR_PREL_PG_HI21 and ADR_PREL_PG_HI21_NC
284	R_AARCH64_ LDST16_ABS_LO12_NC	S + A	Set an LD/ST immediate value to bits [11:1] of X. No overflow check
285	R_AARCH64_ LDST32_ABS_LO12_NC	S + A	Set the $\mathtt{LD/ST}$ immediate value to bits [11:2] of X. No overflow check
286	R_AARCH64_ LDST64_ABS_LO12_NC	S + A	Set the $\mathtt{LD/ST}$ immediate value to bits [11:3] of X. No overflow check

Code	Name	Operation	Comment
299	R_AARCH64_ LDST128_ABS_LO12_NC	S + A	Set the $\mathtt{LD}/\mathtt{ST}$ immediate value to bits [11:4] of X. No overflow check

Note Relocations 284, 285, 286 and 299 are intended to be used with R\_AARCH64\_ADR\_PREL\_PG\_HI21 (275) so they pick out the low 12 bits of the address and, in effect, scale that by the access size. The increased address range provided by scaled addressing is not supported by these relocations because the extra range is unusable in conjunction with R\_AARCH64\_ADR\_PREL\_PG\_HI21. Although overflow must not be checked, a linker should check that the value of X is aligned to a multiple of the datum size.

Table 4-10, Relocations for control-flow instructions - all offsets are a multiple of 4

Code	Name	Operation	Comment
279	R_AARCH64_TSTBR14	S+A-P	Set the immediate field of a TBZ/TBNZ instruction to bits [15:2] of X; check $-2^{15} \le X < 2^{15}$
280	R_AARCH64_CONDBR19	S+A-P	Set the immediate field of a <i>conditional branch</i> instruction to bits [20:2] of X; check $-2^{20} \le X < 2^{20}$
282	R_AARCH64_JUMP26	S+A-P	Set a B immediate field to bits [27:2] of X; check that $-2^{27} \le X < 2^{27}$
283	R_AARCH64_CALL26	S+A-P	Set a CALL immediate field to bits [27:2] of X; check that $-2^{27} \le X < 2^{27}$

#### Table 4-11, Group relocations to create a 16, 32, 48, or 64 bit PC-relative offset inline

Note Non-checking (\_NC) forms relocate MOVK; checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
287	R_AARCH64_MOVW_PREL_G0	S+A-P	Set a MOV[NZ]immediate field to bits [15:0] of X (see notes below)
288	R_AARCH64_MOVW_PREL_G0_NC	S+A-P	Set a MOVK immediate field to bits [15:0] of X. No overflow check
289	R_AARCH64_MOVW_PREL_G1	S+A-P	Set a MOV[NZ]immediate field to bits [31:16] of X (see notes below)
290	R_AARCH64_MOVW_PREL_G1_NC	S+A-P	Set a MOVK immediate field to bits [31:16] of X. No overflow check
291	R_AARCH64_MOVW_PREL_G2	S+A-P	Set a MOV[NZ]immediate value to bits [47:32] of X (see notes below)
292	R_AARCH64_MOVW_PREL_G2_NC	S+A-P	Set a MOVK immediate field to bits [47:32] of X. No overflow check
293	R_AARCH64_MOVW_PREL_G3	S+A-P	Set a MOV[NZ]immediate value to bits [63:48] of X (see notes below)

**Note**  $X \ge 0$ : Set the instruction to MOVZ and its immediate value to the selected bits of X; for relocation  $R_{...}Gn$ , check that  $X < \{G0: 2^{16}, G1: 2^{32}, G2: 2^{48}\}$  (no check for  $R_{...}G3$ ).

**Note** X < 0: Set the instruction to MOVN and its immediate value to NOT (selected bits of X); for relocation  $R_{...}Gn$ , check that  $-\{G0: 2^{16}, G1: 2^{32}, G2: 2^{48}\} \le X$  (no check for  $R_{...}G3$ ).

Table 4-12, Group relocations to create a 16, 32, 48, or 64 bit GOT-relative offsets inline

Note Non-checking ( $\_{NC}$ ) forms relocate MOVK; checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
300	R_AARCH64_MOVW_GOTOFF_G0	G(GDAT(S+A)) -GOT	Set a MOV[NZ] immediate field to bits [15:0] of X (see notes above)
301	R_AARCH64_MOVW_GOTOFF_G0_NC	G(GDAT(S+A)) -GOT	Set a MOVK immediate field to bits [15:0] of X. No overflow check
302	R_AARCH64_MOVW_GOTOFF_G1	G(GDAT(S+A)) -GOT	Set a MOV[NZ] immediate value to bits [31:16] of X (see notes above)
303	R_AARCH64_MOVW_GOTOFF_G1_NC	G(GDAT(S+A)) -GOT	Set a MOVK immediate value to bits [31:16] of X. No overflow check
304	R_AARCH64_MOVW_GOTOFF_G2	G(GDAT(S+A)) -GOT	Set a MOV[NZ] immediate value to bits [47:32] of X (see notes above)
305	R_AARCH64_MOVW_GOTOFF_G2_NC	G(GDAT(S+A)) -GOT	Set a MOVK immediate value to bits [47:32] of X. No overflow check
306	R_AARCH64_MOVW_GOTOFF_G3	G(GDAT(S+A)) -GOT	Set a MOV[NZ] immediate value to bits [63:48] of X (see notes above)

## Table 4-13, GOT-relative data relocations

Code	Name	Operation	Comment
307	R_AARCH64_GOTREL64	S+A-GOT	Set the data to a 64-bit offset relative to the GOT.
308	R_AARCH64_GOTREL32	S+A-GOT	Set the data to a 32-bit offset relative to GOT, treated as signed; check that $-2^{31} \le X < 2^{31}$

## Table 4-14, GOT-relative instruction relocations

Code	Name	Operation	Comment
309	R_AARCH64_GOT_LD_PREL19	G(GDAT(S+A))-P	Set a load-literal immediate field to bits [20:2] of X; check $-2^{20} \le X < 2^{20}$
310	R_AARCH64_LD64_GOTOFF_LO15	G(GDAT(S+A))-GOT	Set a LD/ST immediate field to bits [14:3] of X; check that $0 \le X < 2^{15}$ , X&7 = 0
311	R_AARCH64_ADR_GOT_PAGE	Page(G(GDAT(S+A))) -Page(P)	Set the immediate value of an ADRP to bits [32:12] of X; check that $-2^{32} \le X < 2^{32}$
312	R_AARCH64_LD64_GOT_LO12_NC	G(GDAT(S+A))	Set the LD/ST immediate field to bits [11:3] of X. No overflow check; check that $X\&7=0$
313	R_AARCH64_LD64_GOTPAGE_LO15	G(GDAT(S+A))- Page(GOT)	Set the LD/ST immediate field to bits [14:3] of X; check that $0 \le X < 2^{15}$ , $X\&7 = 0$

## 4.6.7 Call and Jump relocations

There is one relocation code ( $R_AARCH64_CALL26$ ) for function call (BL) instructions and one ( $R_AARCH64_JUMP26$ ) for jump (B) instructions.

A linker may use a veneer (a sequence of instructions) to implement a relocated branch if the relocation is either R\_AARCH64\_CALL26 or R\_AARCH64\_JUMP26 and:

- ☐ The target symbol has type STT\_FUNC.
- Or, the target symbol and relocated place are in separate sections input to the linker.
- Or, the target symbol is undefined (external to the link unit).

In all other cases a linker shall diagnose an error if relocation cannot be effected without a veneer. A linker generated veneer may corrupt registers IPO and IP1 [AAPCS64] and the condition flags, but must preserve all other registers. Linker veneers may be needed for a number of reasons, including, but not limited to:

- □ Target is outside the addressable span of the branch instruction (+/- 128MB).
- Target address will not be known until run time, or the target address might be pre-empted.

In some systems indirect calls may also use veneers in order to support dynamic linkage that preserves pointer comparability (all reference to the function resolve to the same address).

On platforms that do not support dynamic pre-emption of symbols an unresolved weak reference to a symbol relocated by R\_AARCH64\_CALL26 shall be treated as a jump to the next instruction (the call becomes a no-op). The behaviour of R\_AARCH64\_JUMP26 in these conditions is not specified by this standard.

## 4.6.8 Group relocations

A relocation code whose name ends in  $\_Gn$  or  $\_Gn\_NC$  (n = 0, 1, 2, 3) relocates an instruction in a group of instructions that generate a single value or address (see Table 4-7, Table 4-8, Table 4-11, Table 4-12). Each such relocation relocates one instruction in isolation, with no need to determine all members of the group at link time.

These relocations operate by performing the relocation calculation then extracting a field from the result X. Generating the field for a Gn relocation directive starts by examining the residual value Yn after the bits of abs(X) corresponding to less significant fields have been masked off from X. If M is the mask specified in the table recording the relocation directive,  $Yn = abs(X) \& \sim ((M \& -M) - 1)$ .

Overflow checking is performed on Yn unless the name of the relocation ends in "\_NC".

Finally the bit-field of X specified in the table (those bits of X picked out by 1-bits in M) is encoded into the instruction's literal field as specified in the table. In some cases other instruction bits may need to be changed according to the sign of X.

For "MOVW" type relocations it is the assembler's responsibility to encode the hw bits (bits 21 and 22) to indicate the bits in the target value that the immediate field represents.

## 4.6.9 Proxy-generating relocations

A number of relocations generate proxy locations that are then subject to dynamic relocation. The proxies are normally gathered together in a single table, called the Global Offset Table or GOT. Table 4-12, *Group relocations to create a 16, 32, 48, or 64 bit GOT-relative offsets inline* and

Table 4-14, GOT-relative instruction relocations list the relocations that generate proxy entries.

All of the GOT entries generated by these relocations are subject to dynamic relocations (§4.6.11, Dynamic relocations).

#### 4.6.10 Relocations for thread-local storage

The static relocations needed to support thread-local storage in a SysV-type environment are listed in tables in the following subsections

In addition to the terms defined in §4.6.3, *Relocation types*, the tables listing the static relocations relating to thread-local storage use the following terms in the column named *Operation*.

- ☐ GLDM(S) represents a consecutive pair of 64-bit entries in the GOT for the load module index of the symbol S. The first 64-bit entry will be relocated with R\_AARCH64\_TLS\_DTPMOD64(S); the second 64-bit entry will contain the constant 0.
- □ GTLSIDX(S,A) represents a consecutive pair of 64-bit entries in the GOT. The entry contains a tls\_index structure describing the thread-local variable located at offset A from thread-local symbol S. The first 64-bit entry will be relocated with R\_AARCH64\_TLS\_DTPMOD64(S), the second 64-bit entry will be relocated with R\_AARCH64\_TLS\_DTPREL64(S+A).
- ☐ GTPREL(S+A) represents a 64-bit entry in the GOT for the offset from the current thread pointer (TP) of the thread-local variable located at offset A from the symbol S. The entry will be relocated with R\_AARCH64\_TLS\_TPREL64(S+A).
- □ GTLSDESC(S+A) represents a consecutive pair of 64-bit entries in the GOT which contain a tlsdesc structure describing the thread-local variable located at offset A from thread-local symbol S. The first entry holds a pointer to the variable's TLS descriptor resolver function and the second entry holds a platform-specific offset or pointer. The pair of 64-bit entries will be relocated with R\_AARCH64\_TLSDESC(S+A).
- □ LDM(S) resolves to the load module index of the symbol S.
- DTPREL(S+A) resolves to the offset from its module's TLS block of the thread local variable located at offset A from thread-local symbol S.
- □ TPREL(S+A) resolves to the offset from the current thread pointer (TP) of the thread local variable located at offset A from thread-local symbol S.
- □ TLSDESC(S+A) resolves to a contiguous pair of 64-bit values, as created by GTLSDESC(S+A).

# 4.6.10.1 General Dynamic thread-local storage model

#### Table 4-15, General Dynamic TLS relocations

Note Non-checking (\_NC) MOVW forms relocate MOVK; checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
512	R_AARCH64_TLSGD_ ADR_PREL21	G(GTLSIDX(S,A)) - P	Set an ADR immediate field to bits [20:0] of X; check $-2^{20} \le X < 2^{20}$
513	R_AARCH64_TLSGD_ ADR_PAGE21	<pre>Page(G(GTLSIDX(S,A))) - Page(P)</pre>	Set an ADRP immediate field to bits [32:12] of X; check $-2^{32} \le X < 2^{32}$
514	R_AARCH64_TLSGD_ ADD_L012_NC	G(GTLSIDX(S,A))	Set an ADD immediate field to bits [11:0] of X. No overflow check
515	R_AARCH64_TLSGD_ MOVW_G1	G(GTLSIDX(S,A)) - GOT	Set a MOV[NZ] immediate field to bits [31:16] of X (see notes below)
516	R_AARCH64_TLSGD_ MOVW_G0_NC	G(GTLSIDX(S,A)) - GOT	Set a MOVK immediate field to bits [15:0] of X. No overflow check

**Note**  $X \ge 0$ : Set the instruction to MOVZ and its immediate value to the selected bits of X; check that  $X < 2^{32}$ .

**Note** X < 0: Set the instruction to MOVN and its immediate value to NOT (selected bits of X); check that  $-2^{32} \le X$ .

## 4.6.10.2 Local Dynamic thread-local storage model

# Table 4-16, Local Dynamic TLS relocations

Note Non-checking (\_NC) MOVW forms relocate MOVK; checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
517	R_AARCH64_TLSLD_ ADR_PREL21	G(GLDM(S))) - P	Set an ADR immediate field to bits [20:0] of X; check $-2^{20} \le X < 2^{20}$
518	R_AARCH64_TLSLD_ ADR_PAGE21	Page(G(GLDM(S))) -Page(P)	Set an ADRP immediate field to bits [32:12] of X; check $-2^{32} \le X < 2^{32}$
519	R_AARCH64_TLSLD_ ADD_L012_NC	G(GLDM(S))	Set an ADD immediate field to bits [11:0] of X. No overflow check
520	R_AARCH64_TLSLD_ MOVW_G1	G(GLDM(S)) - GOT	Set a MOV[NZ] immediate field to bits [31:16] of X (see notes above)
521	R_AARCH64_TLSLD_ MOVW_G0_NC	G(GLDM(S)) - GOT	Set a MOVK immediate field to bits [15:0] of X. No overflow check
522	R_AARCH64_TLSLD_ LD_PREL19	G(GLDM(S)) - P	Set a load-literal immediate field to bits [20:2] of X; check $-2^{20} \le X \le 2^{20}$
523	R_AARCH64_TLSLD_ MOVW_DTPREL_G2	DTPREL(S+A)	Set a MOV[NZ] immediate field to bits [47:32] of X (see notes below)

528	R_AARCH64_TLSLD_ ADD_DTPREL_HI12	DTPREL(S+A)	Set an ADD immediate field to bits [23:12] of X; check $0 \le X < 2^{24}$
529	R_AARCH64_TLSLD_ ADD_DTPREL_LO12	DTPREL(S+A)	Set an ADD immediate field to bits [11:0] of X; check $0 \le X < 2^{12}$
530	R_AARCH64_TLSLD_ ADD_DTPREL_LO12_NC	DTPREL(S+A)	Set an ADD immediate field to bits [11:0] of X. No overflow check
531	R_AARCH64_TLSLD_ LDST8_DTPREL_LO12	DTPREL(S+A)	Set a LD/ST offset field to bits [11:0] of X; check $0 \le X < 2^{12}$
532	R_AARCH64_TLSLD_ LDST8_DTPREL_LO12_NC	DTPREL(S+A)	Set a LD/ST offset field to bits [11:0] of X. No overflow check
533	R_AARCH64_TLSLD_ LDST16_DTPREL_LO12	DTPREL(S+A)	Set a LD/ST offset field to bits [11:1] of X; check $0 \le X < 2^{12}$
534	R_AARCH64_TLSLD_ LDST16_DTPREL_LO12_NC	DTPREL(S+A)	Set a LD/ST offset field to bits [11:1] of X. No overflow check

Code	Name	me Operation Comment	
535	R_AARCH64_TLSLD_ LDST32_DTPREL_LO12	DTPREL(S+A)	Set a LD/ST offset field to bits [11:2] of X; check $0 \le X \le 2^{12}$
536	R_AARCH64_TLSLD_ LDST32_DTPREL_LO12_NC	DTPREL(S+A)	Set a ${\tt LD/ST}$ offset field to bits [11:2] of X. No overflow check
537	R_AARCH64_TLSLD_ LDST64_DTPREL_LO12	DTPREL(S+A)	Set a LD/ST offset field to bits [11:3] of X; check $0 \le X \le 2^{12}$
538	R_AARCH64_TLSLD_ LDST64_DTPREL_LO12_NC	DTPREL(S+A)	Set a ${\tt LD/ST}$ offset field to bits [11:3] of X. No overflow check
572	R_AARCH64_TLSLD_ LDST128_DTPREL_LO12	DTPREL(S+A)	Set a LD/ST offset field to bits [11:4] of X; check $0 \le X \le 2^{12}$
573	R_AARCH64_TLSLD_ LDST128_DTPREL_LO12_NC	DTPREL(S+A)	Set a LD/ST offset field to bits [11:4] of X. No overflow check

Note  $X \ge 0$ : Set the instruction to MOVZ and its immediate value to the selected bits S; for relocation  $R_{-}..._{Gn}$ , check that  $X < \{G0: 2^{16}, G1: 2^{32}, G2: 2^{48}\}$  (no check for  $R_{-}..._{G3}$ ).

## 4.6.10.3 Initial Exec thread-local storage model

#### Table 4-17, Initial Exec TLS relocations

Note Non-checking (\_NC) MOVW forms relocate MOVK; checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
539	R_AARCH64_TLSIE_ MOVW_GOTTPREL_G1	G(GTPREL(S+A)) - GOT	Set a MOV[NZ] immediate field to bits [31:16] of X (see notes above)
540	R_AARCH64_TLSIE_ MOVW_GOTTPREL_G0_NC	G(GTPREL(S+A)) - GOT	Set MOVK immediate to bits [15:0] of X. No overflow check
541	R_AARCH64_TLSIE_ ADR_GOTTPREL_PAGE21	<pre>Page(G(GTPREL(S+A))) - Page(P)</pre>	Set an ADRP immediate field to bits [32:12] of X; check $-2^{32} \le X < 2^{32}$
542	R_AARCH64_TLSIE_ LD64_GOTTPREL_LO12_NC	G(GTPREL(S+A))	Set an LD offset field to bits [11:3] of X. No overflow check; check that X&7=0
543	R_AARCH64_TLSIE_ LD_GOTTPREL_PREL19	G(GTPREL(S+A)) - P	Set a load-literal immediate to bits [20:2] of X; check $-2^{20} \le X < 2^{20}$

#### 4.6.10.4 Local Exec thread-local storage model

## Table 4-18, Local Exec TLS relocations

Note Non-checking (\_NC) MOVW forms relocate MOVK; checking forms relocate MOVN or MOVZ.

Code	Name	Operation	Comment
544	R_AARCH64_TLSLE_ MOVW_TPREL_G2	TPREL(S+A)	Set a MOV[NZ] immediate field to bits [47:32] of X (see notes above)

Note X < 0: Set the instruction to MOVN and its immediate value to NOT (selected bits of); for relocation  $R_{....}Gn$ , check that  $-\{G0: 2^{16}, G1: 2^{32}, G2: 2^{48}\} \le X$  (no check for  $R_{....}G3$ ).

**Note** For scaled-addressing relocations 533-538, 572 and 573, a linker should check that X is a multiple of the datum size.

Code	Name	Operation	Comment
545	R_AARCH64_TLSLE_ MOVW_TPREL_G1	TPREL(S+A)	Set a MOV[NZ] immediate field to bits [31:16] of X (see notes above)
546	R_AARCH64_TLSLE_ MOVW_TPREL_G1_NC	TPREL(S+A)	Set a MOVK immediate field to bits [31:16] of X. No overflow check
547	R_AARCH64_TLSLE_ MOVW_TPREL_G0	TPREL(S+A)	Set a MOV[NZ] immediate field to bits [15:0] of X (see notes above)
548	R_AARCH64_TLSLE_ MOVW_TPREL_G0_NC	TPREL(S+A)	Set a MOVK immediate field to bits [15:0] of X. No overflow check
549	R_AARCH64_TLSLE_ ADD_TPREL_HI12	TPREL(S+A)	Set an ADD immediate field to bits [23:12] of X; check $0 \le X < 2^{24}$ .
550	R_AARCH64_TLSLE_ ADD_TPREL_LO12	TPREL(S+A)	Set an ADD immediate field to bits [11:0] of X; check $0 \le X < 2^{12}$ .
551	R_AARCH64_TLSLE_ ADD_TPREL_LO12_NC	TPREL(S+A)	Set an ADD immediate field to bits [11:0] of X. No overflow check
552	R_AARCH64_TLSLE_ LDST8_TPREL_LO12	TPREL(S+A)	Set a LD/ST offset field to bits [11:0] of X; check $0 \le X < 2^{12}$ .
553	R_AARCH64_TLSLE_ LDST8_TPREL_LO12_NC	TPREL(S+A)	Set a LD/ST offset field to bits [11:0] of X. No overflow check
554	R_AARCH64_TLSLE_ LDST16_TPREL_LO12	TPREL(S+A)	Set a LD/ST offset field to bits [11:1] of X; check $0 \le X < 2^{12}$
555	R_AARCH64_TLSLE_ LDST16_TPREL_LO12_NC	TPREL(S+A)	Set a LD/ST offset field to bits [11:1] of X. No overflow check
556	R_AARCH64_TLSLE_ LDST32_TPREL_LO12	TPREL(S+A)	Set a LD/ST offset field to bits [11:2] of X; check $0 \le X < 2^{12}$
557	R_AARCH64_TLSLE_ LDST32_TPREL_LO12_NC	TPREL(S+A)	Set a LD/ST offset field to bits [11:2] of X. No overflow check
558	R_AARCH64_TLSLE_ LDST64_TPREL_LO12	TPREL(S+A)	Set a LD/ST offset field to bits [11:3] of X; check $0 \le X < 2^{12}$
559	R_AARCH64_TLSLE_ LDST64_TPREL_LO12_NC	TPREL(S+A)	Set a LD/ST offset field to bits [11:3] of X. No overflow check
570	R_AARCH64_TLSLE_ LDST128_TPREL_LO12	TPREL(S+A)	Set a LD/ST offset field to bits [11:4] of X; check $0 \le X < 2^{12}$
571	R_AARCH64_TLSLE_ LDST128_TPREL_LO12_NC	TPREL(S+A)	Set a LD/ST offset field to bits [11:4] of X. No overflow check

**Note** For scaled-addressing relocations 554-559, 570 and 571 a linker should check that X is a multiple of the datum size.

#### 4.6.10.5 Thread-local storage descriptors

#### Table 4-19, TLS descriptor relocations

Code	Name Operation Comment		Comment	
560	R_AARCH64_TLSDESC_ G(GTLSDESC(S+A)) - P LD_PREL19		Set a load-literal immediate to bits [20:2]; check $-2^{20} \le X < 2^{20}$ ; check $X \& 3 = 0$ .	
561	R_AARCH64_TLSDESC_ ADR_PREL21	G(GTLSDESC(S+A) - P	Set an ADR immediate field to bits [20:0]; check $-2^{20} \le X < 2^{20}$ .	
562	R_AARCH64_TLSDESC_ ADR_PAGE21	Page(G(GTLSDESC(S+A))) - Page(P)	Set an ADRP immediate field to bits [32:12] of X; check $-2^{32} \le X < 2^{32}$ .	
563	R_AARCH64_TLSDESC_ LD64_LO12	G(GTLSDESC(S+A))	Set an LD offset field to bits [11:3] of X. No overflow check; check X & $7 = 0$ .	
564	R_AARCH64_TLSDESC_ ADD_L012	G(GTLSDESC(S+A))	Set an ADD immediate field to bits [11:0] of X. No overflow check.	
565	R_AARCH64_TLSDESC_ OFF_G1	G(GTLSDESC(S+A)) - GOT	Set a MOV[NZ] immediate field to bits [31:16] of X; check $-2^{32} \le X < 2^{32}$ . See notes below.	
566	R_AARCH64_TLSDESC_ OFF_G0_NC	G(GTLSDESC(S+A)) - GOT	Set a MOVK immediate field to bits [15:0] of X. No overflow check.	
567	R_AARCH64_TLSDESC_ LDR	None	For relaxation only. Must be used to identify an LDR instruction which loads the TLS descriptor function pointer for S + A if it has no other relocation.	
568	R_AARCH64_TLSDESC_ ADD	None	For relaxation only. Must be used to identify an ADD instruction which computes the address of the TLS Descriptor for S + A if it has no other relocation.	
569	R_AARCH64_TLSDESC_ CALL	None	For relaxation only. Must be used to identify a BLR instruction which performs an indirect call to the TLS descriptor function for S + A.	

**Note**  $X \ge 0$ : Set the instruction to MOVZ and its immediate value to the selected bits of X.

**Note** X < 0: Set the instruction to MOVN and its immediate value to NOT (selected bits of X).

Relocation codes R\_AARCH64\_TLSDESC\_LDR, R\_AARCH64\_TLSDESC\_ADD and R\_AARCH64\_TLSDESC\_CALL are needed to permit linker optimization of TLS descriptor code sequences to use Initial-exec or Local-exec TLS sequences; this can only be done if all relevant uses of TLS descriptors are marked to permit accurate relaxation. Object producers that are unable to satisfy this requirement must generate traditional General-dynamic TLS sequences using the relocations described in §4.6.10.1, General Dynamic thread-local storage model. The details of TLS descriptors are beyond the scope of this specification; a general introduction can be found in [TLSDESC].

#### 4.6.11 Dynamic relocations

The dynamic relocations for those execution environments that support only a limited number of run-time relocation types are listed in *Table 4-20, Dynamic relocations*. The enumeration of dynamic relocations commences at 1024 and the range is compact.

Table 4-20, Dynamic relocations

Code	Name	Operation	Comment
1024	R_AARCH64_COPY		See note below.
1025	R_AARCH64_GLOB_DAT	S + A	See note below
1026	R_AARCH64_JUMP_SLOT	S + A	See note below
1027	R_AARCH64_RELATIVE	Delta(S) + A	See note below
1028	R_AARCH64_TLS_DTPREL64	DTPREL(S+A)	
1029	R_AARCH64_TLS_DTPMOD64	LDM(S)	
1030	R_AARCH64_TLS_TPREL64	TPREL(S+A)	
1031	R_AARCH64_TLSDESC	TLSDESC(S+A)	Identifies a TLS descriptor to be filled
1032	R_AARCH64_IRELATIVE Indirect(Delta(S) See note below. + A)		See note below.

With the exception of R\_AARCH64\_COPY all dynamic relocations require that the place being relocated is an 8-byte aligned 64-bit data location.

- R\_AARCH64\_COPY may only appear in executable ELF files where e\_type is set to ET\_EXEC. The effect is to cause the dynamic linker to locate the target symbol in a shared library object and then to copy the number of bytes specified by its st\_size field to the place. The address of the place is then used to pre-empt all other references to the specified symbol. It is an error if the storage space allocated in the executable is insufficient to hold the full copy of the symbol. If the object being copied contains dynamic relocations then the effect must be as if those relocations were performed before the copy was made.
- R\_AARCH64\_COPY is normally only used in SysV type environments where the executable is not position-independent and references by the code and read-only data sections cannot be relocated dynamically to refer to an object that is defined in a shared library.

The need for copy relocations can be avoided if a compiler generates all code references to such objects indirectly through a dynamically relocatable location and if all static data references are placed in relocatable regions of the image. In practice, this is difficult to achieve without source-code annotation. A better approach is to avoid defining static global data in shared libraries.

- R\_AARCH64\_GLOB\_DAT relocates a GOT entry used to hold the address of a (data) symbol which must be resolved at load time.
- R\_AARCH64\_JUMP\_SLOT is used to mark code targets that will be executed.
- On platforms that support dynamic binding the relocations may be performed lazily on demand.
- ☐ The initial value stored in the place is the offset to the entry sequence stub for the dynamic linker. It must be adjusted during initial loading by the offset of the load address of the segment from its link address.
- □ Addresses stored in the place of these relocations may not be used for pointer comparison until the relocation after has been resolved.
- □ Because the initial value of the place is not related to the ultimate target of a R\_AARCH64\_JUMP\_SLOT relocation the addend A of such a REL-type relocation shall be zero rather than the initial content of the place. A platform ABI shall prescribe whether or not the r\_addend field of such a RELA-type relocation is honored. (There may be security-related reasons not to do so).
- **R\_AARCH64\_RELATIVE** represents a relative adjustment to the place based on the load address of the object relative to its original link address. All symbols defined in the same segment will have the same relative adjustment. If S is the null symbol (ELF symbol index 0) then the adjustment is based on the segment defining the place. On systems where all segments are mapped contiguously the adjustment will be the same for each

reloction, thus adjustment never needs to resolve the symbol. This relocation represents an optimization; it can be used to replace R\_AARCH64\_GLOB\_DAT when the symbol resolves to the current dynamic shared object.

**R\_AARCH64\_IRELATIVE** represents a dynamic selection of the place's resolved value. The means by which this relocation is generated is platform specific, as are the conditions that must hold when resolving takes place.

## 4.6.12 Private and platform-specific relocations

Relocation codes 0xE000 through 0xEFFF denote private relocations for vendor experiments.

Relocation codes 0xF000 through 0xFFFF denote relocations defined by the platform ABI. They can only be interpreted when the EI OSABI field is set to indicate the Platform ABI governing the definition.

These codes will not be assigned by any future version of this standard.

#### 4.6.13 Unallocated relocations

All unallocated relocation types are reserved for use by future revisions of this specification.

#### 4.6.14 Idempotency

All RELA type relocations are idempotent. They may be reapplied to the place and the result will be the same. This allows a static linker to preserve full relocation information for an image by converting all REL type relocations into RELA type relocations.

**Note** A REL type relocation can only be idempotent if the original addend was zero and if subsequent re-linking assumes that REL relocations have zero for all addends.

# 5 PROGRAM LOADING AND DYNAMIC LINKING

This section provides details of AArch64-specific definitions and changes relating to executable images.

# 5.1 Program Header

The Program Header provides a number of fields that assist in interpretation of the file. Most of these are specified in the base standard [SCO-ELF]. The following fields have AArch64-specific meanings.

#### p type

Table 5-1, Processor-specific segment types lists the processor-specific segment types.

Table 5-1, Processor-specific segment types

Name	p_type	Meaning
PT_AARCH64_ARCHEXT	0x70000000	Reserved for architecture compatibility information
PT_AARCH64_UNWIND	0x70000001	Reserved for exception unwinding tables

A segment of type PT\_AARCH64\_ARCHEXT (if present) contains information describing the architecture capabilities required by the executable file. Not all platform ABIs require this segment; the Linux ABI does not. If the segment is present it must appear before segment of type PT\_LOAD.

PT\_AARCH64\_UNWIND (if present) describes the location of a program's exception unwind tables.

#### p\_flags

There are no AArch64-specific flags.

## 5.1.1 Platform architecture compatibility data

At this time this ABI specifies no generic platform architecture compatibility data.

# 5.2 Program Loading

There are no AArch64-specific definitions relating to program loading.

# 5.3 Dynamic Linking

## 5.3.1 Dynamic Section

There are no AArch64-specific dynamic array tags.
